ARCHITECTURE PRESENTATION

MyRota Application Overview

A central operations dashboard for rota planning, team visibility, Jira tracking, and linked LC EDI microsites. This deck explains how the application is assembled, how data moves through it, and how it is deployed.

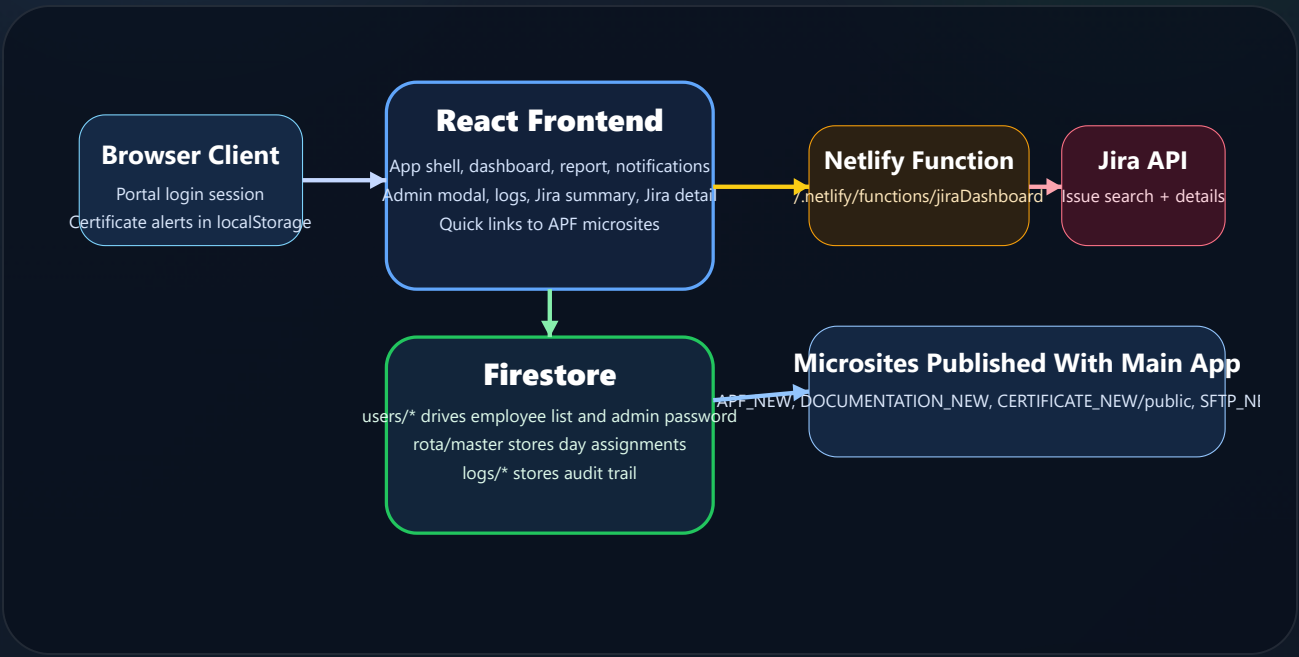
BUSINESS VIEW

What The Application Delivers

SYSTEM DESIGN

Runtime Architecture

The application is primarily a browser-side React app. It reads and writes rota data directly with Firestore, while Jira data is proxied through a Netlify Function so browser clients never need direct Jira credentials.



DATA MODEL

Firestore Collections And Responsibilities

Collection / Document	Purpose	How The App Uses It
users/{username}	Employee master data and ordering metadata	Used to build the employee list; `users/admin.password` is used for Edit ROTA admin mode
rota/master	Central rota document	Stores keyed assignments like year-month-week-employee-day with shift and leave data
logs/{logId}	Audit trail	Written whenever admin updates rota cells; shown on the Logs page
config/admin	Optional backup admin configuration	Still supported as a secondary fallback if `users/admin` is unavailable

REPOSITORY VIEW

Main Folders And Ownership

Path	Role	Notes
src/	Main MyRota frontend	Primary working area for dashboard, admin mode, reports, notifications, and Jira UI
src/jira/	Jira frontend integration	API client, summary panel, and issue detail page
netlify/functions/	Serverless endpoints	Current production Jira backend entrypoint
netlify/jira/	Jira query helpers	JQL definitions, payload shaping, environment handling
scripts/	Build support	Copies microsites into the publish folder after the Vite build
APF/	Linked microsites and legacy assets	Kept outside the main app code path and published selectively
docs/	Documentation set	Contains this presentation and the detailed technical document
